# Status of Mediterranean and Black Sea resources in European Waters in 2013

## Guidelines for the evaluation of stock status

### Terminology

- **Spawning stock biomass (SSB)** is the biomass of the adult or reproducing fish
- **Fishing mortality (F)** is the proportion of fish in the stock that are taken by the fisheries
- $F_{MSY}$  is the F associated to high long term yields and the long-term sustainable exploitation of the stock
- $F/F_{MSY}$  indicates how far each stock is from the MSY target

# Mediterranean and Black Sea stock assessment unit

## FAO GFCM sub-areas (GSA's)

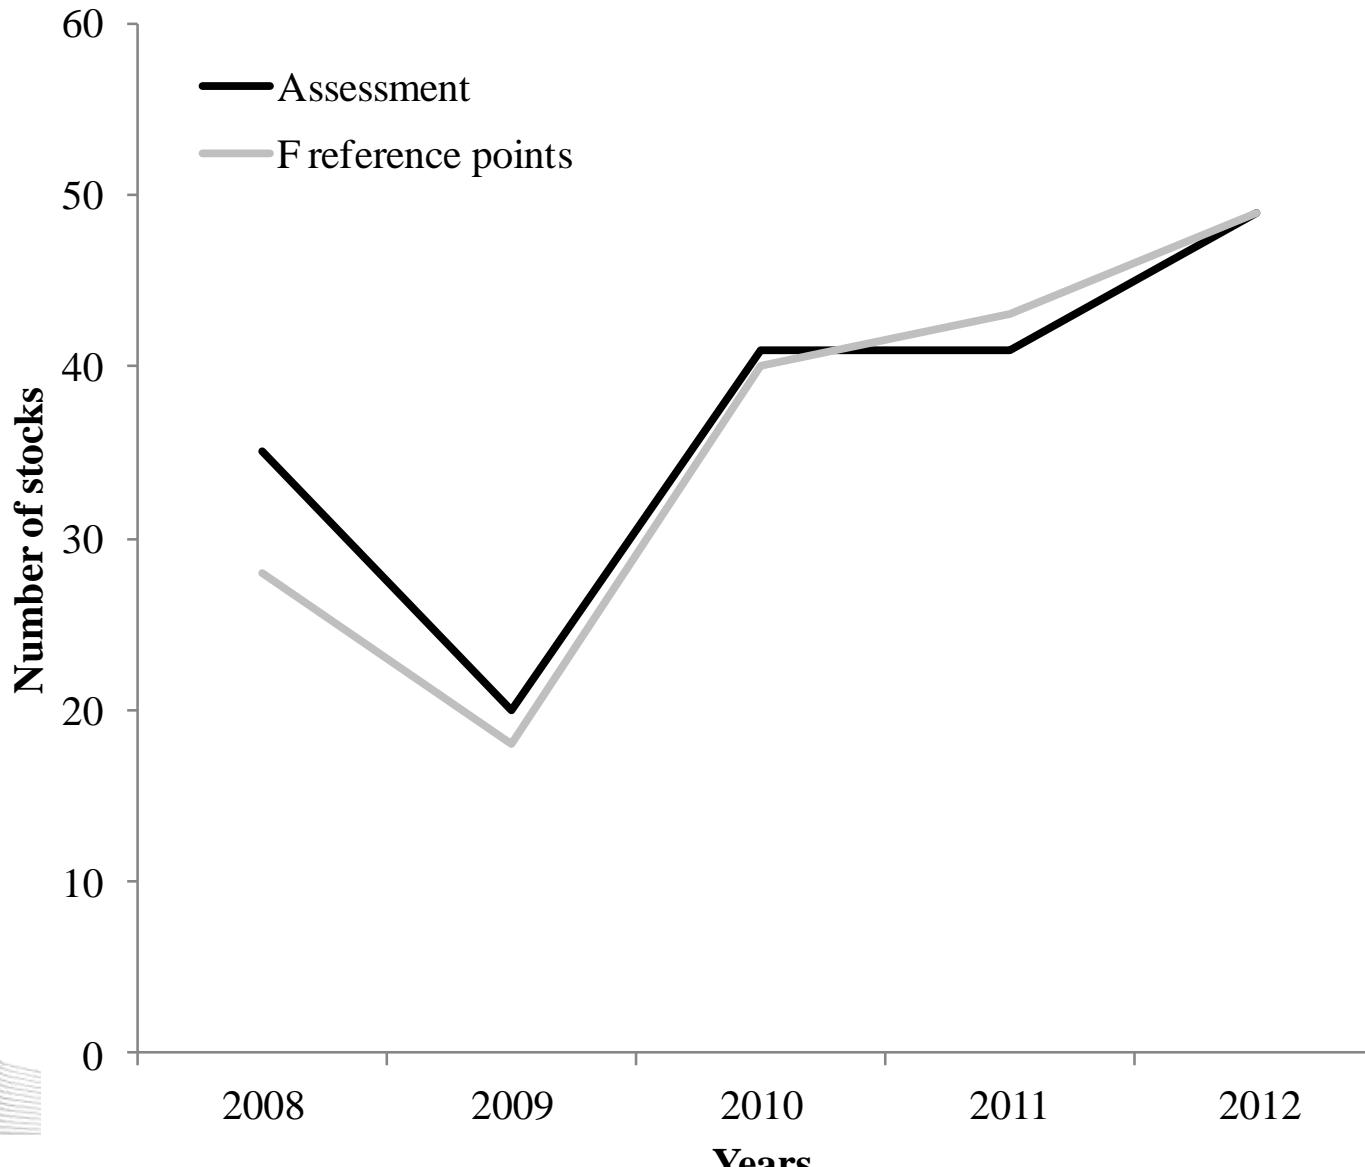

— FAO Statistical Divisions (red)

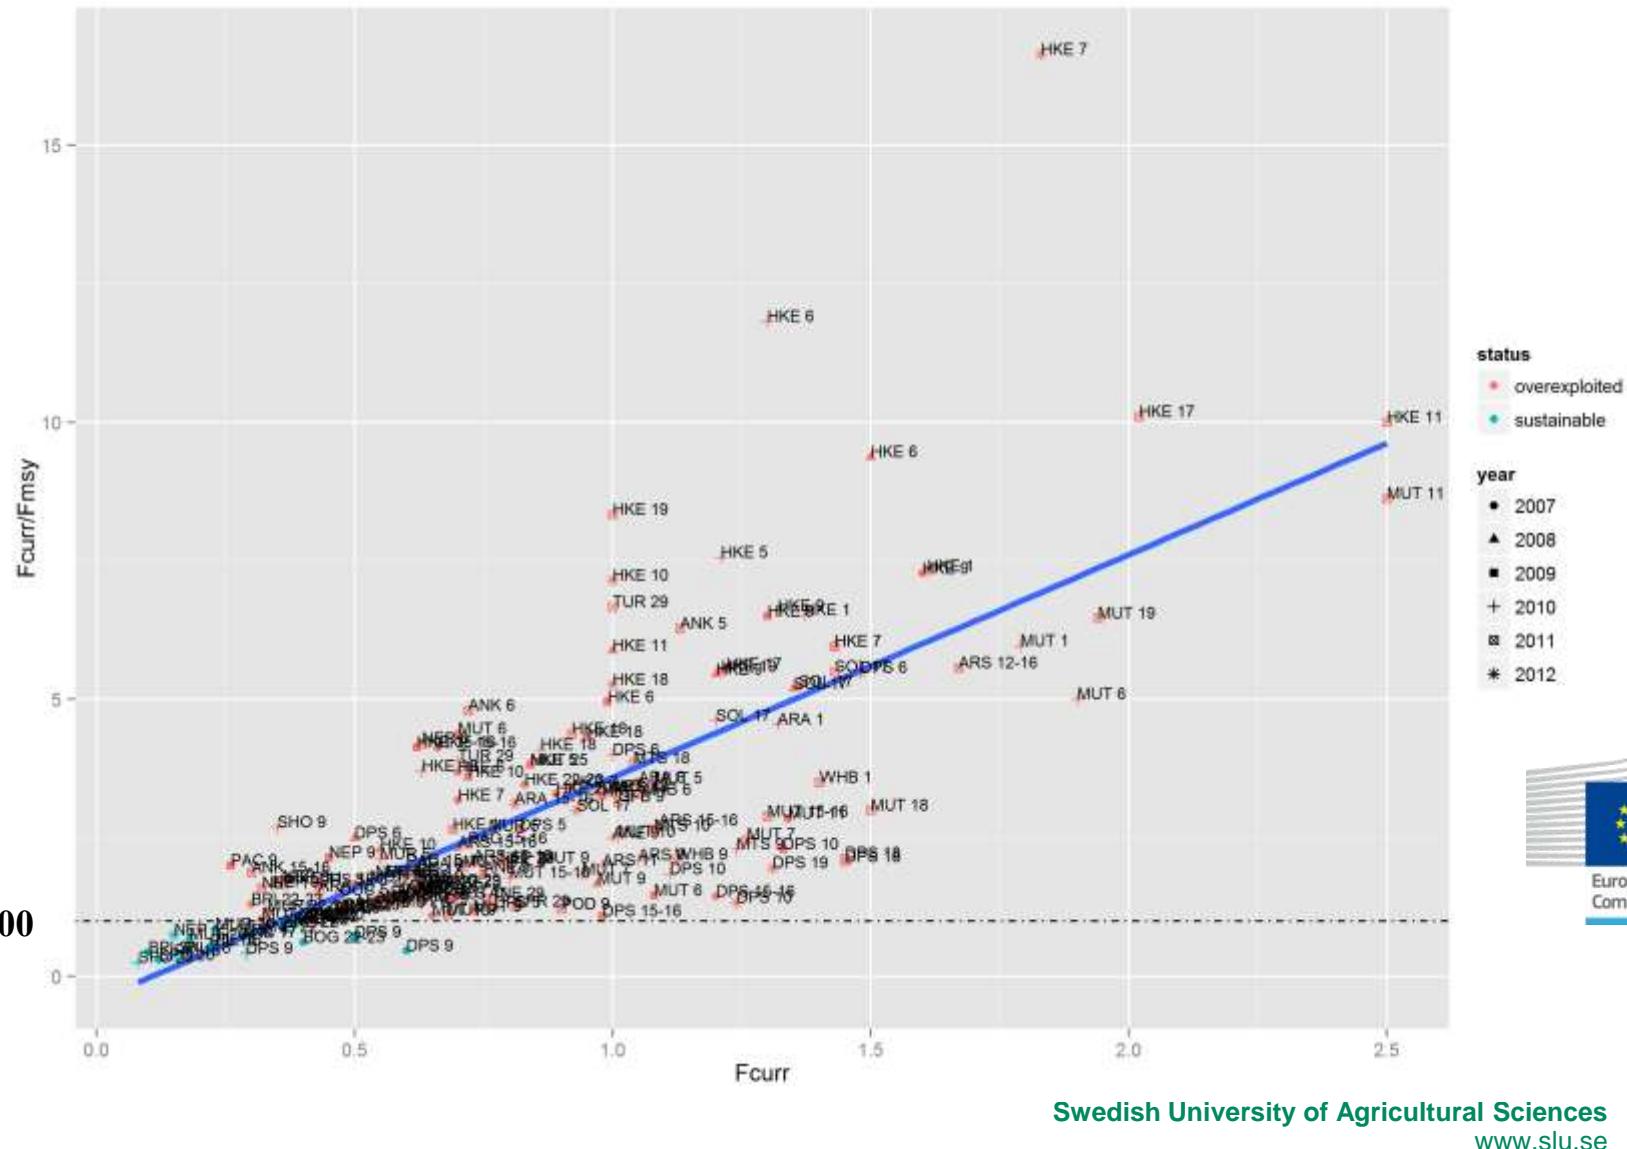

— GFCM Geographical Sub-Areas (black)

01 - Northern Alboran Sea	07 - Gulf of Lions	13 - Gulf of Hammamet	19 - Western Ionian Sea	25 - Cyprus Island
02 - Alboran Island	08 - Corsica Island	14 - Gulf of Gabes	20 - Eastern Ionian Sea	26 - South Levant
03 - Southern Alboran Sea	09 - Ligurian and North Tyrrhenian Sea	15 - Malta Island	21 - Southern Ionian Sea	27 - Levant
04 - Algeria	10 - South and Central Tyrrhenian Sea	16 - South of Sicily	22 - Aegean Sea	28 - Marmara Sea
05 - Balearic Island	11.1 - Sardinia (west) 11.2 - Sardinia (east)	17 - Northern Adriatic	23 - Crete Island	29 - Black Sea
06 - Northern Spain	12 - Northern Tunisia	18 - Southern Adriatic Sea	24 - North Levant	30 - Azov Sea

Around 95% of the analysed Mediterranean and Black Sea stocks are estimated to be exploited unsustainably in 2010-2011

# Modelling achievements

STECF

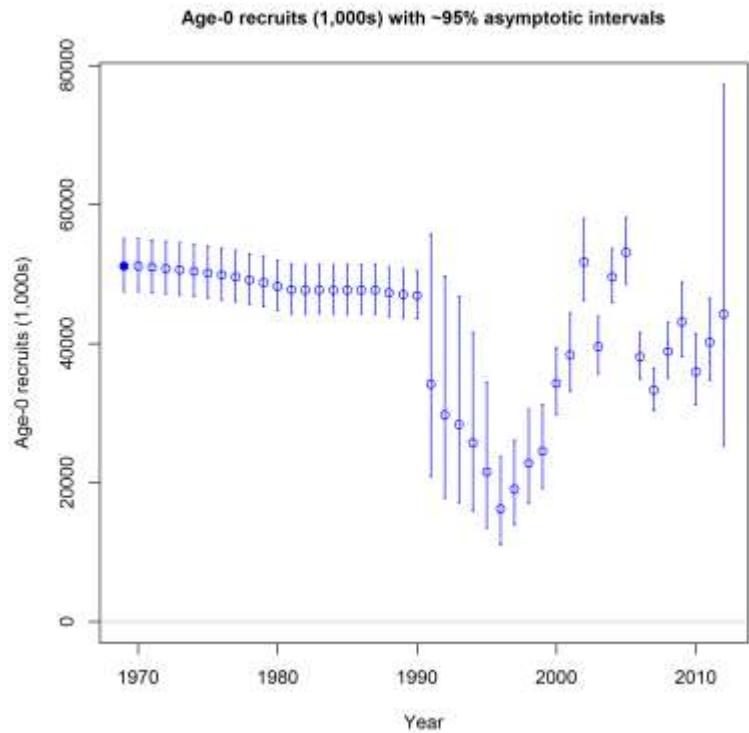

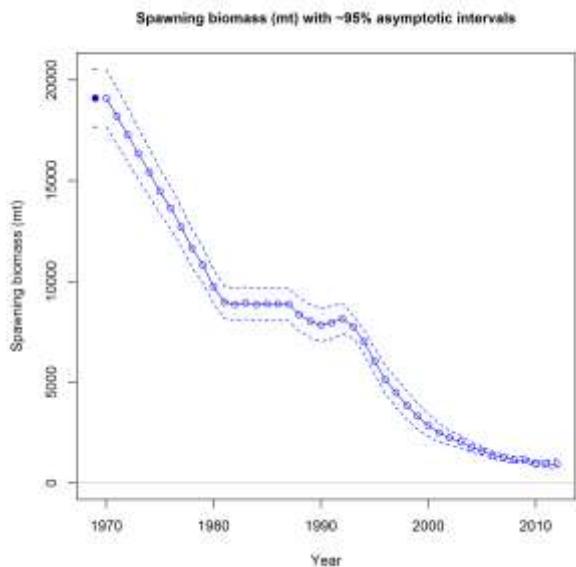

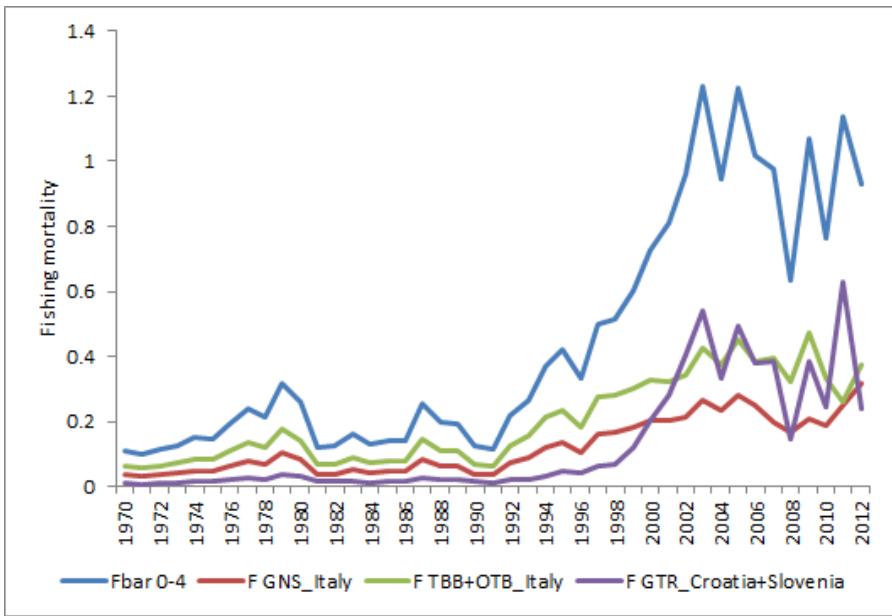

Moving from XSA to statistical catch at age model (e.g. SS3)

Main advantages over classic VPA and other SCAA models:

- Provide estimates of uncertainty
- Can estimate M
- Can provide different functional response for selectivity
- Can handle multi fleets

# Modelling achievements

STECF

# Productivity and Susceptibility analysis

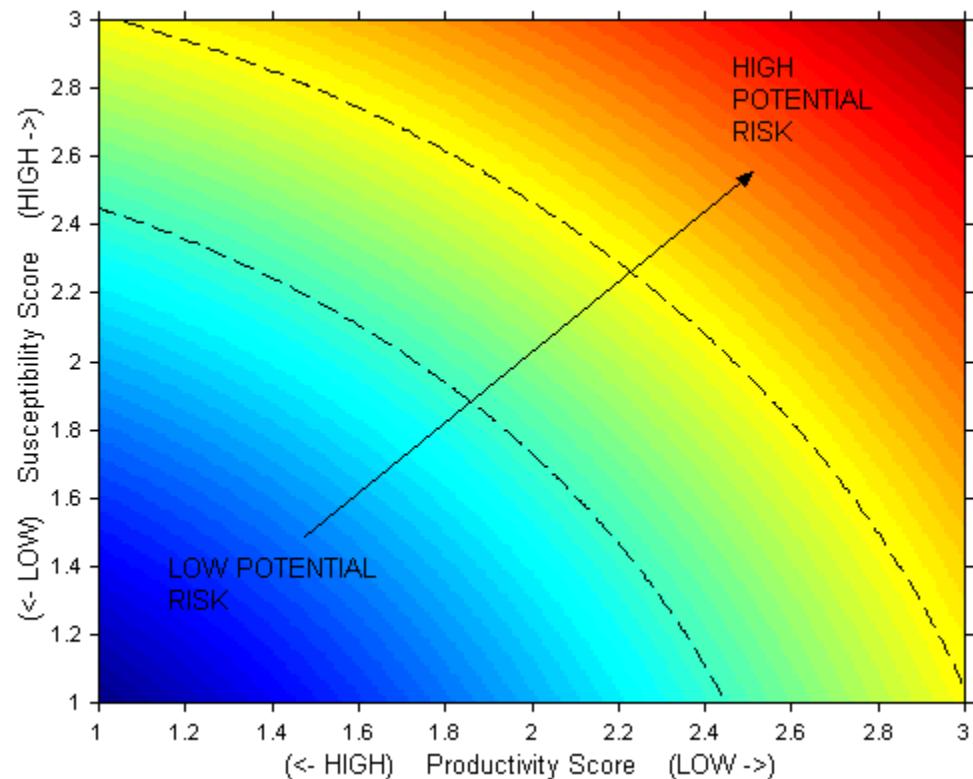

151 Mediterranean Demersal and bathydemersal fish stocks

## Productivity Attributes:

- Maximum age ( $t_{max}$ )
- Maximum size ( $L_{max}$ )
- Growth coefficient ( $k$ )
- Natural mortality ( $M$ )
- Fecundity
- Age-at-maturity ( $t_{mat}$ )
- Mean trophic level

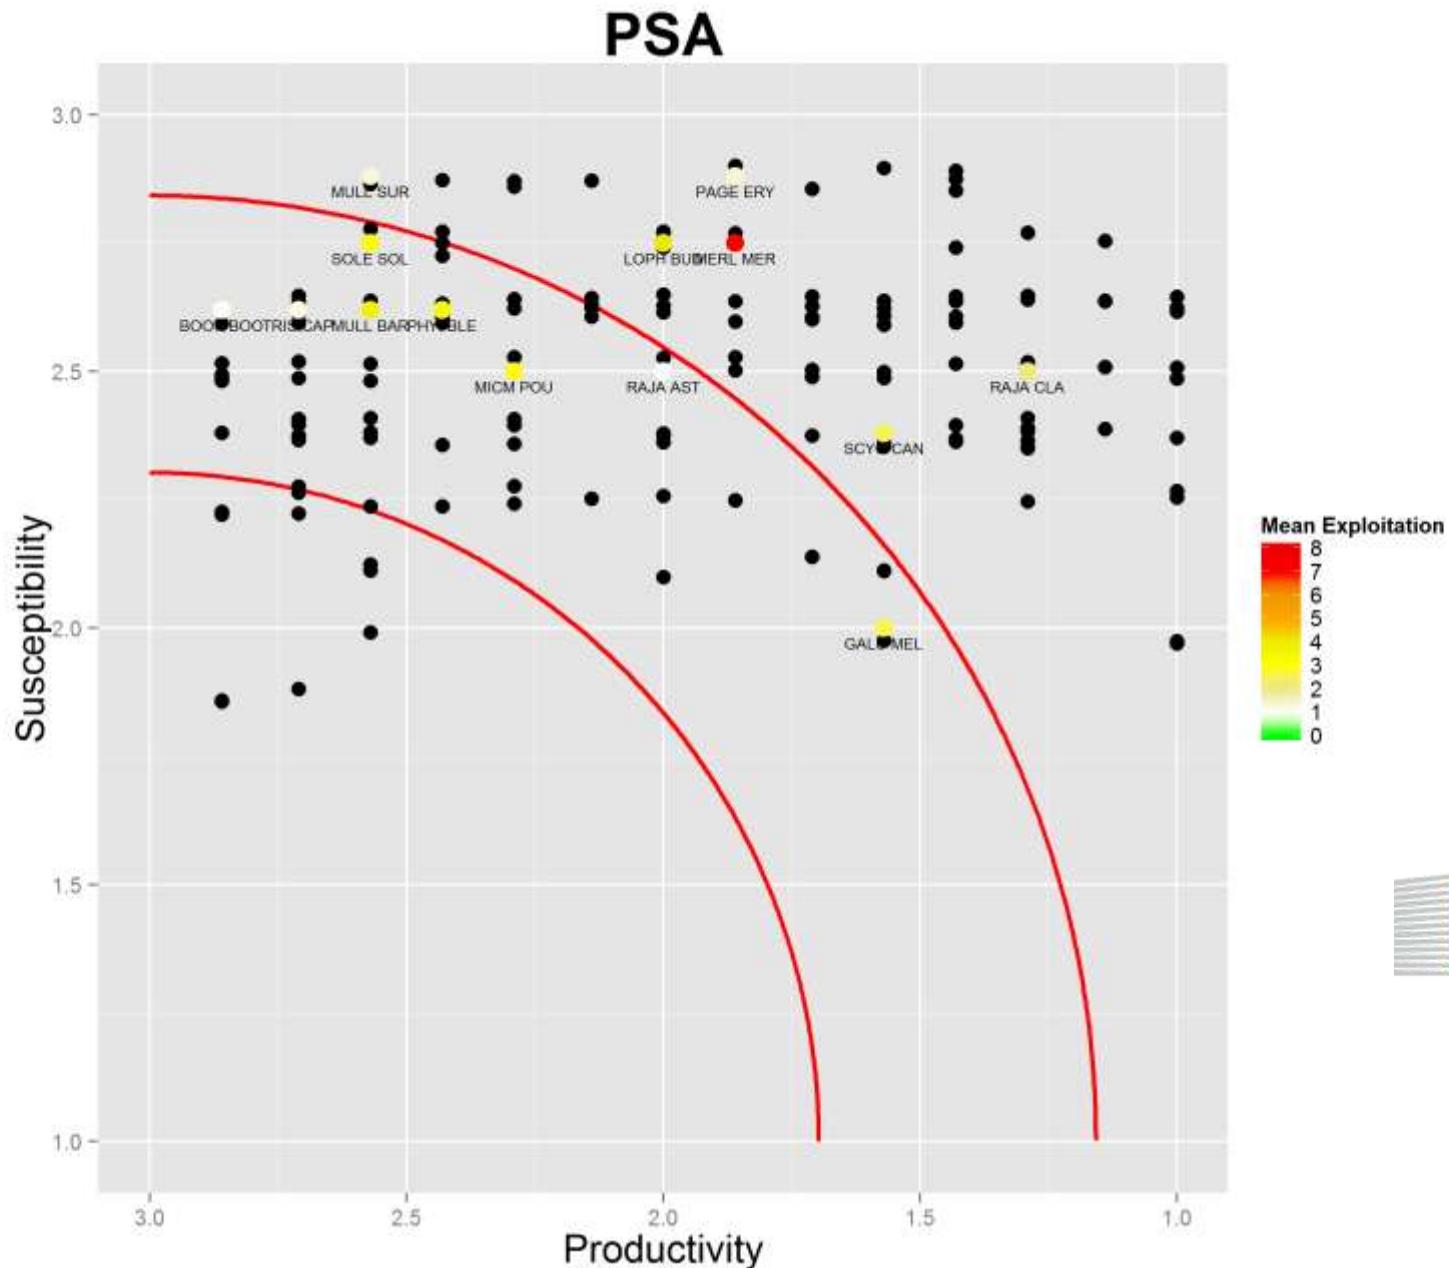

## Susceptibility attributes:

- Areal overlap
- Vertical overlap
- Morphological characteristics affecting capture
- Desirability or value of the fishery
- Management strategy
- Fishing mortality rate (in relation to  $M$ )
- Survival after capture and release.

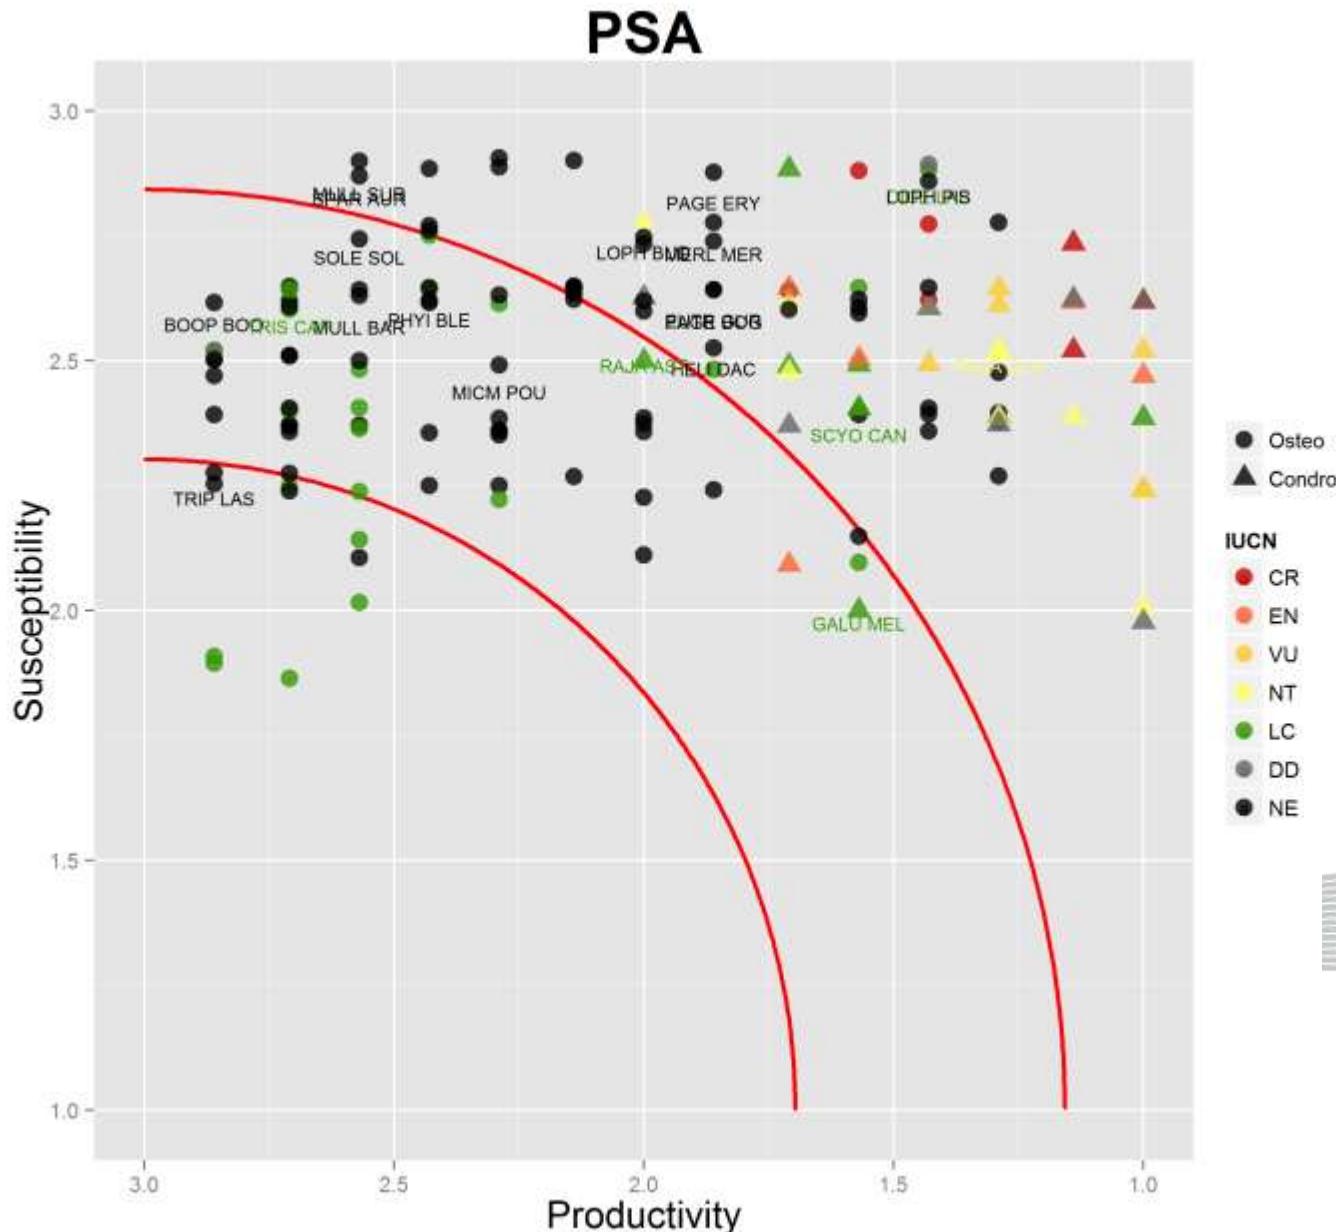

From Hobday et al. 2007

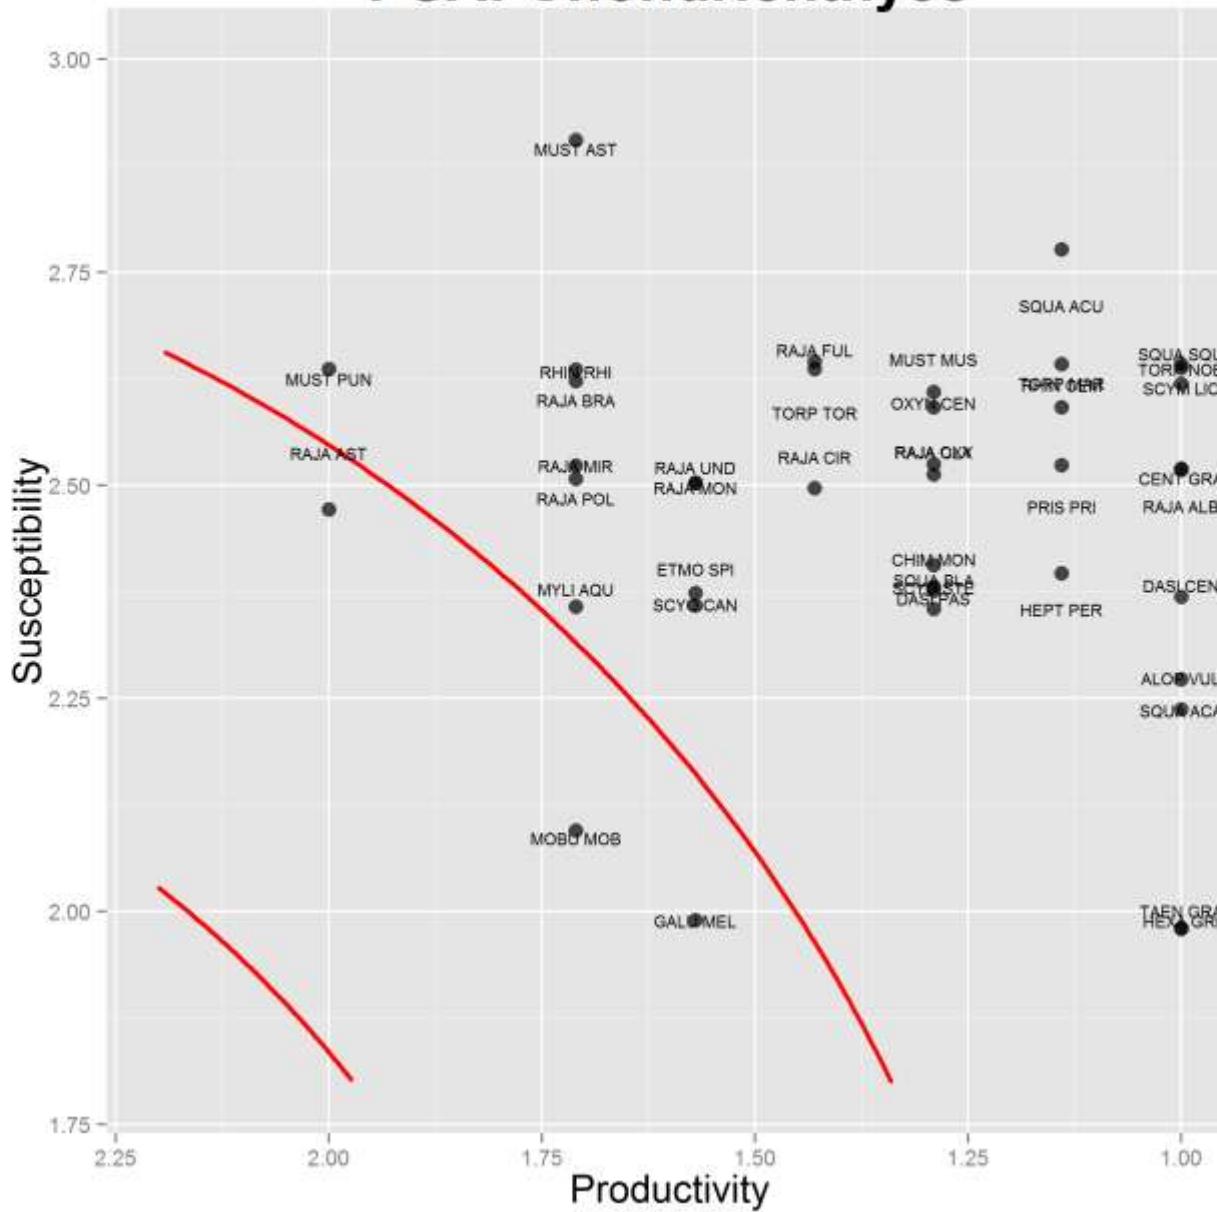

# Species with estimated Mean Exploitation level

# IUCN Classification

# PSA: Chondrichthyes

# Status of Mediterranean and Black Sea marine resources

## State of the art

- State of knowledge on the Mediterranean and Black Sea stocks is improving rapidly
- Between 94% and 95% of the stocks analysed is overexploited compared to  $F_{MSY}$
- An overall reduction between 45% and 51% in F is necessary to reach MSY
- Reducing F will not reach MSY without changes in selectivity
- Observed reduction in nominal effort did not result in a decline in F

# Status of Mediterranean and Black Sea marine resources

## Immediate actions

- Reduce F for all demersal fisheries through reduction in effort or/and catches
- Implement a TAC system for small pelagics
- Modify gear selectivity to move towards MSY
- Several stocks are shared fisheries/stocks with non EU countries and thus a strong coordination and collaboration between GFCM-SAC and SGMED is crucial in the future

# Status of Mediterranean and Black Sea marine resources

Way forward

- Move to stock integrated models which can estimate M, handle multifleet data and model selectivity
